

B.Sc. Physical Sciences with Physics as one of the Core Disciplines

DISCIPLINE SPECIFIC ELECTIVE COURSE – DSE 7-5: NANOSCIENCE

Course Title and Code	Credits	Credit distribution of the course			Pre-requisite of the course
		Lecture	Tutorial	Practical	
Nanoscience DSE 7-5	4	2	0	2	

COURSE OBJECTIVES

The syllabus introduces the basic concepts of nanomaterials, their synthesis, properties exhibited by them and finally few applications. Various nanomaterial synthesis/growth methods and characterizations techniques are discussed to explore the field in detail. The effect of dimensional confinement of charge carries on the electrical, optical and structural properties will be discussed. Interesting experiments which shape this filed like conductance quantization in 2DEG (Integer Quantum Hall Effect) and coulomb blockade are introduced. The concept of micro- and nano- electro mechanical systems (MEMS and NEMS) and important applications areas of nanomaterials are discussed.

LEARNING OUTCOMES

On successful completion of the course students should be able to

- explain the difference between nanomaterials and bulk materials and their property difference.
- explain various methods for the synthesis/growth of nanomaterials.
- explain the role of confinement on the density of state function and so on the various properties exhibited by nanomaterials compared to bulk materials.
- explain the concept of Quasi-particles such as excitons and how they influence the optical properties.
- explain the direct and indirect bandgap semiconductors, radiative and non-radiative processes and the concept of luminescence.
- explain the structure of 2DEG system and its importance in quantum transport experiments, like Interger Quantum Hall Effect and conductance quantization.
- explain the conductance quantization in 1D structure and its difference from the 2DEG system.

- explain the necessary and sufficient conditions required to observe coulomb blockade, single electron transistor and the scope of these devices.
- explain how MEMS and NEMS devices are produced and their applications.

SYLLABUS OF DSE 7-5
THEORY COMPONENT
(Hours: 30)

Unit I

(11 Hours)

Introduction

Basic Introduction to Nano-Science and Technology - Implications on nanoscience on fields like Physics, Chemistry, Biology and Engineering, Classifications of nanostructured materials as quantum dots (0D), nanowires (1D), Thin films (2D) and Multi-layered materials or super lattices. Introduction to properties like Mechanical, Electronic, Optical, Magnetic and Thermal properties and how they change at Nano scale dimensions to motivate students (qualitative only).

Nanoscale Systems

Brief review of Schrodinger equation and its applications in- Infinite potential well, potential step and potential box problems, Band Structure and Density of states of 3D and 2D systems in detail and qualitatively for 1D and 0D, confinement of charges in nanostructures their consequences on electronic and optical properties.

Unit II

(10 Hours)

Properties of Nano Scale systems

Time and length scales (diffusion, elastic and inelastic lengths etc.) of electrons in nanostructured materials, Carrier transport in nanostructures: diffusive and ballistic transport.

2D nanomaterials: Conductance quantization in 2DEG in GaAs and integer quantum hall effect (semi-classical treatment)

1D nanomaterials: Conductance quantization in 1D structures using split gate in 2DEG system (Qualitative).

0D nanomaterials: Charging effect, Coulomb Blockade effect, Single Electron Transfer (SET) device.

Basic understanding of excitons in semiconductors and their consequence on optical properties of the material

Unit III

(5 Hours)

Synthesis of Nanomaterials (Qualitative)

Top-down and Bottom-up approach, Ball milling, Spin Coating

Vacuum deposition: Physical vapor deposition (PVD): Thermal evaporation, Sputtering, Chemical vapor deposition (CVD). Preparation of colloidal solutions of Metals, Metal Oxide nanoparticles

Unit IV

(4 Hours)

Applications (Qualitative)

Micro Electromechanical Systems (MEMS), Nanoelectromechanical Systems (NEMS). Applications of nanomaterials as probes in medical diagnostics and targeted drug delivery, sunscreen, lotions, and paints and other examples to give broader perspective of applications of nanomaterials.

PRACTICAL COMPONENT: NANOSCIENCE

(Hours: 60)

At least 06 experiments from the following:

1. Synthesis of metal (e.g. Ag) nanoparticles by chemical route and study its optical absorption properties.
2. Synthesis of semiconductor (CdS/ZnO/TiO₂/Fe₂O₃ etc) nanoparticles and study its Optical Absorption properties as a function of ageing time.
3. Surface Plasmon study of metal nanoparticles as a function of size by UV-Visible spectrophotometer.
4. Analysis of XRD pattern of given nanomaterial and estimate lattice parameters and particle size.
5. To study the effect of the size nanoparticles on its color.
6. To prepare composite of CNTs with other materials and study their optical absorption/Transmission properties.
7. Growth of metallic thin films using thermal evaporation technique.
8. Prepare a ceramic disc of a given compound and study its I-V characteristics, measure its dielectric constant or any other property.
9. Fabricate a thin film of nanoparticles by spin coating (or chemical route) and study its transmittance spectra in UV-Visible region.
10. Prepare thin film capacitor and measure capacitance as a function of temperature or frequency.
11. Fabricate a PN junction diode by diffusing Al over the surface of N-type Si/Ge and study its V-I characteristic.
12. Fabricate thin films (polymer, metal oxide) using electro-deposition
13. To study variation of resistivity or sheet resistance with temperature of the fabricated thin films using four probe method.
